

Soil meter: setup essentials

Confirm the supported medium

Read the model manual before inserting a probe. Confirm permitted soil or potting media, insertion depth and supported modes. Do not assume a soil probe is suitable for liquids, hydroponic solution, every substrate or a laboratory test.

Check the probe and location

Inspect for damage and clean as instructed. Avoid stones, roots, buried cables and hard surfaces. Never force the probe. Record where you checked and the condition of the medium; different locations can produce different readings.

Take comparable observations

Use the manufacturer-specified method and settling time. Keep your sampling location and procedure as consistent as practical. Record whether the medium was recently watered or disturbed. Repeat at a second appropriate location if a result seems unusual.

Record what the display actually says

Keep the reading and unit or scale label together. A bar, category or relative moisture scale is not automatically a laboratory concentration. Do not relabel a device scale as a precise measurement it does not provide.

Need model-specific help?

Follow the manual included with your unit. Email support@mastergrowbot.com with your model and question. No app subscription is needed to use the tool independently.
