REVIEW

Evidence + limits

01 / Choose one question

Try: Does the detail show the same edge as the overview? Give the subject an ID such as P01. A phone and notebook are enough to begin.

02 / Keep your evidence

Save both originals. Write the filenames, date, time and lighting. Do not rely on a chat history as your only copy.

03 / Give AI a small job

Use Prompt 1 on page 13 with the actual images. A filename alone does not give a text-only tool access to the photo.

04 / Save a checked note

Match each statement to its source. Keep the original response separate. Correct errors and write what remains unknown.

YOU ARE FINISHED WHEN

You can find the two photos, name the question and show a reviewed note with its limits. Use workbook page 3 for the session and page 6 for the review.

From rough note to useful record

Worked example. The value below demonstrates recording, not a recommended condition.

THE ROUGH NOTE

P01. Pale area by edge. Took two photos by window. Monitor said 22.4 degrees C on desk. Not sure if settled.

Question	Is the pale area visible in both photos?
Original files	P01_overview.jpg + P01_detail-A.jpg
Display record	22.4 degrees C / Monitor-A / desk / settling unknown
What is visible	Pale area visible in detail; overview too small to confirm.
What stays unknown	Cause, actual color under even light, display accuracy.
Next evidence	Matching overview and detail with readable features in even light.

Why the second version helps

It separates the source from the interpretation. Another reader can locate the images and see exactly which conclusion has not been established.

Two views, one clear question

Illustrative photo atlas. Labels below describe image usability, not plant health.

TOP LEFT / OVERVIEW	Keeps the outline and surrounding context visible.
TOP RIGHT / DETAIL	Shows the edge and surface at a readable size.
BOTTOM LEFT / RETAKE	Blur hides fine detail; do not ask AI to reconstruct it.
BOTTOM RIGHT / LIMIT	Cropping removes context; sharpness alone is not enough.

TRY IT WITH YOUR OWN FILES

Choose an overview and detail of the same subject. Write one feature both should show. If either image cannot show it, record that limitation before using AI.

01 / Describe only what is visible

Make a neutral description you can verify.

THE EVIDENCE YOU SUPPLY

Subject P01. Question: is a pale area visible in both photos? Overview: the feature is too small to resolve. Detail: a light patch appears near a leaf edge. Light: uneven window light. Cause: unknown.

Copy this prompt

Review the attached overview and detail images. Describe visible features only. Return four headings: Visible detail, Image limitations, What cannot be concluded, Next evidence to collect. Refer to each image by filename. If a feature is unreadable, say so. Do not diagnose, infer a cause or recommend treatments. Distinguish what is visible from what is uncertain.

BEFORE YOU PRESS SEND

Replace bracketed text with your notes. Attach the actual images for photo tasks. Identify filenames and limits. Save the input so you can check the answer later.

01 / Check, correct, keep

Illustrative AI response, not a customer case. Your tool may respond differently.

Visible detail	A light patch is visible near an edge in detail-A.
Image limitation	The overview does not resolve the patch clearly.
Unknown	Cause, actual color and whether the overview confirms it.
Next evidence	A matching photo pair with readable detail and more even light.

What to check

Keep the visible description only if it matches your image. Correct the model if it claims both photos confirm the patch. Retake the overview when confirming the same feature matters.

REJECT THIS LEAP

The photos confirm a specific deficiency. A visible patch and uneven lighting do not establish a cause.

Try it / One photo, one claim

Draft: Both images confirm the feature. Only the detail is readable. What should change?

Answer check: Change both images confirm to visible in the detail; overview confirmation unknown.
